

Agentic AI Course - Day 6

Krish Naik - 10h course | Video 3:20-4:00

Building Agents with LangGraph (ReAct)

A ReAct agent reasons and acts: it thinks, calls a tool, sees the result, and repeats until done. LangGraph ships a prebuilt ReAct agent you can use immediately.

Key concepts

- ReAct loop: Reason -> Act (tool) -> Observe -> repeat.
- create_react_agent: give it a model + tools and it builds the agent graph.
- The agent decides which tool to call and when to stop.
- Great for research assistants, Q&A over tools, and multi-step tasks.

Code example

```
from langgraph.prebuilt import create_react_agent

agent = create_react_agent(llm, tools=[add])
out = agent.invoke({'messages': [('user', 'add 40 and 2 then explain')]})
print(out['messages'][-1].content)
```

Today's tasks (1.5h)

- [] Create a react agent with your tools
- [] Ask a question that needs a tool
- [] Inspect the message trace
