

Agentic AI Course - Day 8

Krish Naik - 10h course | Video 4:40-5:20

Embeddings & Vector Stores

Embeddings turn text into vectors (lists of numbers) that capture meaning. A vector store saves these and lets you find the most similar chunks to a query.

Key concepts

- Embedding model: maps text -> a fixed-length vector.
- Similar meaning -> nearby vectors (cosine similarity).
- Vector store (Chroma, FAISS, etc.): stores vectors + lets you query top-k similar.
- Index once, then reuse for fast semantic search.

Code example

```
from langchain_openai import OpenAIEmbeddings
from langchain_community.vectorstores import FAISS

emb = OpenAIEmbeddings()
vs = FAISS.from_texts(chunks, emb)
print(vs.similarity_search('my question', k=3))
```

Today's tasks (1.5h)

- [] Create an embeddings model
- [] Build a FAISS/Chroma store from your chunks
- [] Run a similarity_search
