

Agentic AI Course - Day 1

Krish Naik - 10h course | Video 0:00-0:40

LangChain Setup & Introduction

LangChain is a framework for building applications powered by large language models (LLMs). It gives you standard building blocks - models, prompts, chains - so you can compose LLM calls into real apps. Today you install LangChain v1 and make your first calls.

Key concepts

- Chat models: the LLM interface (e.g. ChatOpenAI). You send a list of messages and get a message back.
- Message types: SystemMessage (instructions), HumanMessage (user input), AIMessage (model reply).
- Environment: set your API key (OPENAI_API_KEY) before calling any model.
- A 'chain' is just components wired together - the smallest chain is prompt -> model -> parser.

Code example

```
from langchain_openai import ChatOpenAI
from langchain_core.messages import SystemMessage, HumanMessage

llm = ChatOpenAI(model='gpt-4o-mini')
resp = llm.invoke([
    SystemMessage('You are a helpful tutor.'),
    HumanMessage('Explain LangChain in one line.')
])
print(resp.content)
```

Today's tasks (1.5h)

- [] Install: `pip install langchain langchain-openai`
- [] Set your API key as an environment variable
- [] Run the snippet and change the messages
