

Agentic AI Course - Day 2

Krish Naik - 10h course | Video 0:40-1:20

Prompts, LCEL & Output Parsers

Prompt templates let you reuse prompts with variables. LCEL (LangChain Expression Language) uses the pipe '|' operator to connect steps. Output parsers turn raw text into clean strings or structured data.

Key concepts

- PromptTemplate / ChatPromptTemplate: templates with {placeholders} you fill at run time.
- LCEL: prompt | model | parser reads left-to-right; each step's output feeds the next.
- StrOutputParser: extracts the plain text from the model message.
- Structured output: ask the model to return JSON / a Pydantic object for reliable parsing.

Code example

```
from langchain_core.prompts import ChatPromptTemplate
from langchain_core.output_parsers import StrOutputParser

prompt = ChatPromptTemplate.from_template('Write a tweet about {topic}')
chain = prompt | llm | StrOutputParser()
print(chain.invoke({'topic': 'agentic AI'}))
```

Today's tasks (1.5h)

- [] Build a ChatPromptTemplate with 2 variables
- [] Chain prompt | model | StrOutputParser
- [] Try a structured (JSON) output parser
