

Agentic AI Course - Day 5

Krish Naik - 10h course | Video 2:40-3:20

LangGraph - Conditional Edges, Cycles & Checkpoints

Branching and loops let an agent decide what to do next and repeat steps. Checkpoints add persistence so a graph can pause and resume.

Key concepts

- Conditional edge: a router function returns the name of the next node based on state.
- Cycles: edges can loop back so the agent keeps working until a condition is met.
- Checkpointer (e.g. MemorySaver): saves state so runs are resumable / stateful.
- thread_id: identifies a conversation so memory persists across calls.

Code example

```
def route(s):  
    return 'again' if s['n'] < 3 else END  
  
g.add_conditional_edges('work', route, {'again': 'work', END: END})
```

Today's tasks (1.5h)

- ☐ Add a router function
- ☐ Wire a conditional edge with a loop
- ☐ Add MemorySaver and pass a thread_id
