

System Design (Telusko) - Day 3

One-Shot 5h course | Video 0:30-0:45

Load Balancing

Distribute traffic across many servers for scale and reliability.

Key concepts

- A load balancer (LB) spreads requests across healthy servers.
- Algorithms: round-robin, least-connections, IP-hash, weighted.
- Health checks remove dead servers automatically.
- L4 (transport) vs L7 (application) load balancing.

Key example

Client -> LB -> [server1, server2, server3]; LB also enables zero-downtime deploys.

Today's tasks (1.5h)

- ☐ Learn the LB algorithms
- ☐ Draw an LB in front of 3 app servers
- ☐ Note how health checks work
