

System Design (Telusko) - Day 6

One-Shot 5h course | Video 1:15-1:30

SQL vs NoSQL Databases

Choose the right database model for your data and access patterns.

Key concepts

- SQL (relational): structured schema, ACID, joins - great for transactions.
- NoSQL: document, key-value, wide-column, graph - flexible & horizontally scalable.
- Pick by access pattern, consistency needs, and scale.
- Polyglot persistence: use multiple DB types together.

Key example

Orders/payments -> SQL (ACID); feeds/sessions/analytics -> NoSQL.

Today's tasks (1.5h)

- ☐ Compare SQL vs NoSQL types
- ☐ Match a use case to each
- ☐ Note ACID vs BASE
