

# System Design (Telusko) - Day 14

One-Shot 5h course | Video 3:15-3:30

## Monolith vs Microservices

Choose an architecture style for your services.

### Key concepts

- Monolith: one deployable - simple to start, harder to scale teams.
- Microservices: small independent services - scalable but complex.
- Trade-offs: deployment, data ownership, network calls, observability.
- Start monolith, split when pain justifies it.

### Key example

Each microservice owns its own database; communicate via APIs/events.

### Today's tasks (1.5h)

- ☐ Compare the two
- ☐ List 3 microservice challenges
- ☐ Decide for a startup app
